Signs You’re Trying to Time the Market

Kate Warne, Ph.D., CFA • Investment Strategist

Everyone wants to be in the right place at the right time, but that’s easier said than done – especially when it comes to your investments. The strategies that put you in the right place at the right time may be different than you expect; while market timing can be tempting, it is rarely successful.

If you answered “yes” to any of these questions, you may be mistakenly trying to time the market. You may just think you’re being cautious or strategic – like switching lanes at the grocery store to try to get through the line faster. However, three of the most common investment mistakes are keeping money on the sidelines, reacting to market predictions and switching investments based on past performance. These actions could lead to undesirable outcomes:

• Missing some of the best days in the market
• Receiving lower returns because you’re not invested
• Switching to investments that underperform rather than outperform

Remember, many attempts to time the market have reduced investor returns rather than raised them. Instead of trying to time the market to reach your long-term financial goals faster, consider three alternative actions:

• Determine the mix of stocks and bonds appropriate for you
• Stay invested even when markets are choppy
• Rebalance your portfolio as needed – which generally means buying investments that have declined in value

At Edward Jones, our investment principles – owning quality investments, taking a long-term perspective and staying diversified – can help you reduce investment risks and may help improve your chances of success.

Don’t React to Predictions

If you hear predictions that stocks could drop, would you want to sell to avoid a possible loss? While it might seem like a foolproof move, consider the possibilities:

• What if the predictions are wrong? If stocks rise instead of falling as predicted, you’re not invested, possibly missing gains. Your return potential may suffer both immediately and over time.
• What if the decline is small and/or brief? Staying invested may result in better returns and be less costly.
• If you sell now and miss a decline, when do you reinvest? If you fail to reinvest, you could miss a rebound. To sell and then buy back means you have to make two timing decisions correctly, which is doubly difficult.
Research has shown that average investors have underperformed the broader stock and bond markets due to chasing performance. Over the last 20 years, the stock benchmark’s annualized return was 7.2%, but the average investor only earned 5.3%. The bond performance gap was even wider, with an annual 4.6% benchmark return compared to investors’ 0.4% return.

### What If the Prediction Is Correct?

Stocks have dropped on average by 10% or more about once a year. But staying invested – despite the high volatility of the past decade – averaged attractive returns of 10.9% per year. Market emotions have always swung quickly from fear to greed, resulting in some of the best days for the market. As the chart below illustrates, the impact of missing just a few of the market’s best days was bigger than you might think.

### Market Timing Doesn’t Work

### Make the Right Moves

Knowing the right investment moves can help turn risks into opportunities. But the wrong moves at the wrong times can be risky and reduce your chances of success. If you’ve been trying to time the market – no doubt without much success – we think there’s a better way. Work with your Edward Jones financial advisor to develop a strategy designed to help you avoid such reactions, reach your long-term goals and feel more comfortable and prepared for the future.

### The Risk of Sitting on the Sidelines

Despite the uncertainties, the right approach hasn’t been to stay on the sidelines. Over the past 10 years, if you chose to get out of the market, missing just the 20 best days would have wiped out nearly all your gains. Furthermore, missing the 30 best days would have resulted in losses.

More important, keep in mind that the stock market is just one risk. Inflation, interest rates and unexpected life events are other risks to factor into your investment strategy. A long-term strategy that addresses all of your financial goals can help reduce those worries as well as some of the risks.
